Underground tunnels drawn on an aerial picture (August 2020)

Sample Environment for Six Instruments

Fixed target sample delivery

- Seven instruments deliver X-rays to user experiments
 - Samples provided by users
 - Large variety
 - Sizes typically in μm scale
 - Repetition rate 10 Hz

- Specification for 2D sample holders
 - Target area: 50x50 or 100x100 mm
 - Travel range: 50 to 120 mm in X and Y
some millimetres in focal plane
 - Accuracy: 1 to 10 μm
 - Speed: 1 to 5 mm with 10 Hz start/stop

SQS Small Quantum Systems

SCS Spectroscopy & Coherent Scattering

Challenges for high-intensity experiments

- Sample damage and debris
 - 1 sample per mm²
 - 100x100 mm -> 10.000 samples
 - Sample for 1000 seconds at 10 Hz
 - ▶ A bit more than ¼ hour
- Automated sample changer required
 - Load lock for vacuum operation
 - ▶ Insert sample without venting main chamber
 - ▶ Store new sample in a safe place
 - Cartridge system
 - ▶ Here for eight 50x50 mm frames

Need for:

- Better fast stages and encoders
 - Movement in **vacuum**
 - Reliable and accurate positioning in **μm scale**
 - Fast acceleration and stopping within **100 ms**
 - Capable of repeated **small movements**
 - **Absolute encoders**
 - Concepts for the **control system** software

Alternative: Top Loader

Other Systems

- Hexapod systems
 - Most compact system for 6 degrees of freedom
 - But:
 - ▶ Limited movement range
 - ▶ Complex dependences

- Robotic arms
 - Issues with
 - ▶ Vacuum compatibility
 - ▶ Space restrictions

Standard Sample Frame System

- **Instrument frame** optimized to fit to the instrument
 - Integrational part of the scanner stage
 - or transferable frame for vacuum systems
 - Interface to the inside is standardized
 - Used at three Instruments (SPB/SFX, HED, FXE)
 - ▶ Modified version at SCS and MID
- **Subframe** optimized for a specific type of sample
 - Directly in the instrument frame
 - or many of them in an **adapter**
 - Fiducials for target localization
 - Unique identifier

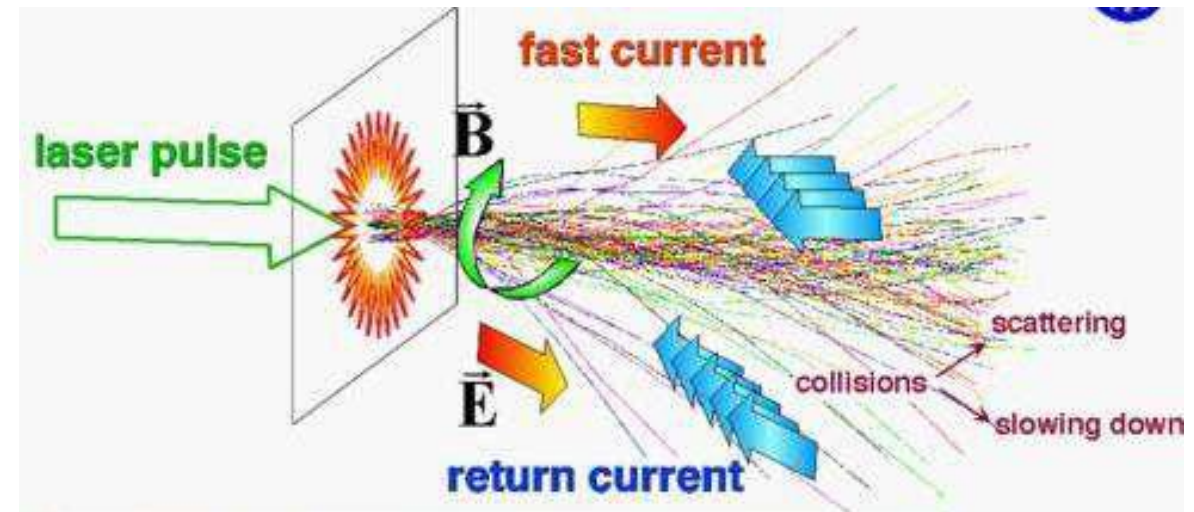

Need for:

- Standardized frames
 - **Cheap and easy** purchase for external users
 - ▶ Catalogue ware
 - **Variations** to user specs
 - **Unique ID** engraved on frame
 - Included **fiducials**

EMP hardness

- We're combining high energy and high power lasers with femtosecond X-ray pulses
- Electromagnetic pulses (EMP)
 - Cause high induction currents
 - Can damage stages, motors and electronics
- **Need for EMP hard solutions!**

Using Machine Learning for Sample Characterization

Towards a Workflow from Sample Pre-Characterization to Automatic 10Hz Measurements

Target database in preparation

Our industrial needs

- We develop compact, fast positioning systems
 - we are interested in new motor concepts for doing this
 - ▶ Accuracy in the order of μm
 - ▶ Movements 100 mm
 - ▶ 1 mm start-stop in 0.1 second
 - EMP hardness is an issue
- Enable users to pre-characterize samples at home
 - Microscopes with absolute, global positioning
 - ▶ Light microscopes
 - ▶ Confocal microscopes
 - ▶ Electron microscopes
 - ▶ Production devices and facilities
 - Software frontends to transfer data points
 - ▶ To a database
 - ▶ Using web protocols or XML files
